

MINE VENTILATION DOOR

HIGH & LOW PRESSURE FIRE DOORS

Door will open or close once activated from a remote area with a signal to the control system. A 10 seconds delay, (before door open or close) is incorporated for safety purposes or as required. The power pack will run for as long as the door is moving to the close or open position and stops once fully open or close. As the door opens or closes, a siren will go off and red and green lights on either side of the door will indicate the position of the door. Once fully open or close the siren deactivates. Doors in an airlock configuration will be interlocked. Provisions are made for the control system at the installation only, client to supply link to the installation area.

LOUVRE AIR CONTROL REGULATOR

The two/dual segment louvres will open and close as signals are received from the remote area and the two segments will open individually. The louvre will take between 30 and 50 seconds to move from fully closed to fully open and vice versa. Red and green lights will indicate the position of the louvre blades, (red closed, green open). The louvre blades actuators will open to a 900 angle. Provisions are made for the control system at the installation only, client to supply link to the installation area.
